

# Fire Weather Index Predictor

(A Machine Learning model to predict Fire Weather)

Infosys Springboard Virtual Internship Program

Submitted By

Potukuchi Sneha

Under the guidance of mentor Praveen

## **Project Statement**

This project focuses on building a Fire Weather Index (FWI) Predictor that estimates wildfire risk using essential environmental and fire-danger features such as temperature, relative humidity, wind speed, rainfall, FFMC, DMC, DC, ISI, and BUI. The dataset is thoroughly cleaned, pre-processed, and analysed to ensure reliable inputs, followed by visual exploration to understand feature distributions and relationships. Machine learning techniques are then applied to learn how weather conditions influence fire danger levels, enabling accurate prediction of the FWI value. The system also incorporates regional information to study area-wise fire behaviour and improve prediction relevance. Overall, the model aims to support early detection, risk assessment, and informed decision-making for effective wildfire management.

## **Expected Outcome**

- A predictive ML model trained using Ridge Regression to forecast FWI.
- A pre-processing pipeline using StandardScaler for normalisation.
- A Flask-based web app where users can input environmental values and get FWI predictions.
- A system that can help forest departments, emergency planners, and climate researchers make data-driven decisions.

## **Modules to be Implemented**

- Data Collection
- Data Exploration (EDA) and Data Preprocessing
- Feature Engineering and Scaling
- Model Training using Ridge Regression
- Evaluation and Optimisation
- Deployment via Flask App
- Presentation and Documentation

## **System Requirements**

## **Software:**

- Python
- Python libraries (pandas, numpy, matplotlib, seaborn etc)
- Flask

## **Milestone 1**

### **1. Module 1 (Data Collection)**

The dataset was collected by exploring multiple online sources and selecting one that contained the essential environmental features required for FWI prediction, including Temperature, Relative Humidity, Wind Speed, Rain, FFMC, DMC, ISI, and Region. After loading the chosen dataset into a Pandas DataFrame, an initial inspection was carried out to understand its structure and quality. This included checking datatypes, identifying null values, reviewing memory usage, and generating statistical summaries to examine the distribution and range of numerical features. The dataset's shape and duplicate entries were also analysed to ensure completeness and reliability, providing a solid foundation for further preprocessing and modelling.

**Conducted initial inspection to understand feature distributions and data quality.**

#### **1. Load the dataset**

```
df  
=pd.read_csv('C:\\\\Users\\\\DELL\\\\OneDrive\\\\Desktop\\\\FWI_Pre  
dictor\\\\Datasets\\\\FWI Dataset.csv')  
  
print("Loaded the dataset using pandas")
```

#### **2. Verify Datatypes**

Data Types of Each Column:

day	int64
month	int64
year	int64
Temperature	int64
RH	int64

Ws	int64
Rain	float64
FFMC	float64
DMC	float64
DC	object
ISI	float64
BUI	float64
FWI	object
Classes	object
Region	object

dtype: object

### 3. Basic Information of the Dataset

#### Head

da y	mon th	ye ar	Temperat ure	R H	W s	Rai n	FFM C	DM C	D C	IS I	B UI	FW I	Clas ses	Regi on
1	6	20 12	29	57	1 8	0.0	65.7	3.4	7. 6	1. 3	3. 4	0.5	not fire	Bejai
2	6	20 12	29	61	1 3	1.3	64.4	4.1	7. 6	1. 0	3. 9	0.4	not fire	Bejai a
3	6	20 12	26	82	2 2	13. 1	47.1	2.5	7. 1	0. 3	2. 7	0.1	not fire	Bejai a
4	6	20 12	25	89	1 3	2.5	28.6	1.3	6. 9	0. 0	1. 7	0.0	not fire	Bejai a
5	6	20 12	27	77	1 6	0.0	64.8	3.0	14. .2	1. 2	3. 9	0.5	not fire	Bejai

#### Tail

day	month	year	Temperature	RH	Ws	Rain	FFMC	DMC	DC	ISI	BUI	FWI	Classes	Region
26	9	2012	30	65	14	0.0	85.4	16.0	.44.5	4.5	6.2	0.0	not fire	Sidi-Bel
27	9	2012	28	87	15	4.4	41.1	6.5	8.0	0.1	3.4	0.2	not fire	Sidi-Bel
28	9	2012	27	87	29	0.5	45.9	3.5	7.9	0.4	2.1	0.7	not fire	Sidi-Bel
29	9	2012	24	54	18	0.1	79.7	4.3	15.2	1.7	4.8	0.5	not fire	Sidi-Bel
30	9	2012	24	64	15	0.2	67.3	3.8	16.5	1.2	4.8	0.5	not fire	Sidi-Bel

The first and last five rows of the dataset were displayed to gain an initial understanding of the data structure, feature values, and overall formatting. This helped verify that all columns loaded correctly, values are aligned, and the dataset is ready for further inspection and preprocessing.

#### 4. Statistical Summary

Statistic	day	month	year	Temp	RH	Ws
count	244	244	244	244	244	244
mean	15.754098	7.500000	2012.0	32.172131	61.938525	15.504098

<b>max</b>	16.800 000	96.00000 0	65.90000 0	220.40000 0	19.00000 0	68.00000 0	31.100000

A statistical summary was generated to examine key numerical characteristics such as mean, median, minimum, maximum, and standard deviation for each feature. This helped assess data variability, detect potential outliers, and understand the overall distribution of numerical values in the dataset.

## 5. Duplicate Values

A statistical summary was generated to examine key numerical characteristics such as mean, median, minimum, maximum, and standard deviation for each feature. This helped assess data variability, detect potential outliers, and understand the overall distribution of numerical values in the dataset.

```
print("Duplicate values")
```

```
print(df.duplicated().sum())
```

## 2. Module 2 (Data Exploration (EDA) and Data Preprocessing)

During the preprocessing stage, the dataset was first examined for missing or null values, and appropriate handling techniques were applied to ensure completeness. Outlier detection was then performed using boxplots and statistical thresholds to identify abnormal values that could affect model performance. To better understand feature behaviour, data distributions were visualised through histograms and density plots, while correlation matrices and scatterplots were used to explore relationships between variables. Categorical features, such as *Region*, were encoded using label encoding to make them suitable for machine learning algorithms. Finally, the cleaned and processed dataset was saved for use in building and evaluating predictive models.

### 1. Handle missing values

Checking for Missing Values:

day	0
month	0
year	0
Temperature	0
RH	0
Ws	0
Rain	0
FFMC	0
DMC	0
DC	0
ISI	0
BUI	0

```
FWI      1
```

```
Classes   1
```

```
Region    0
```

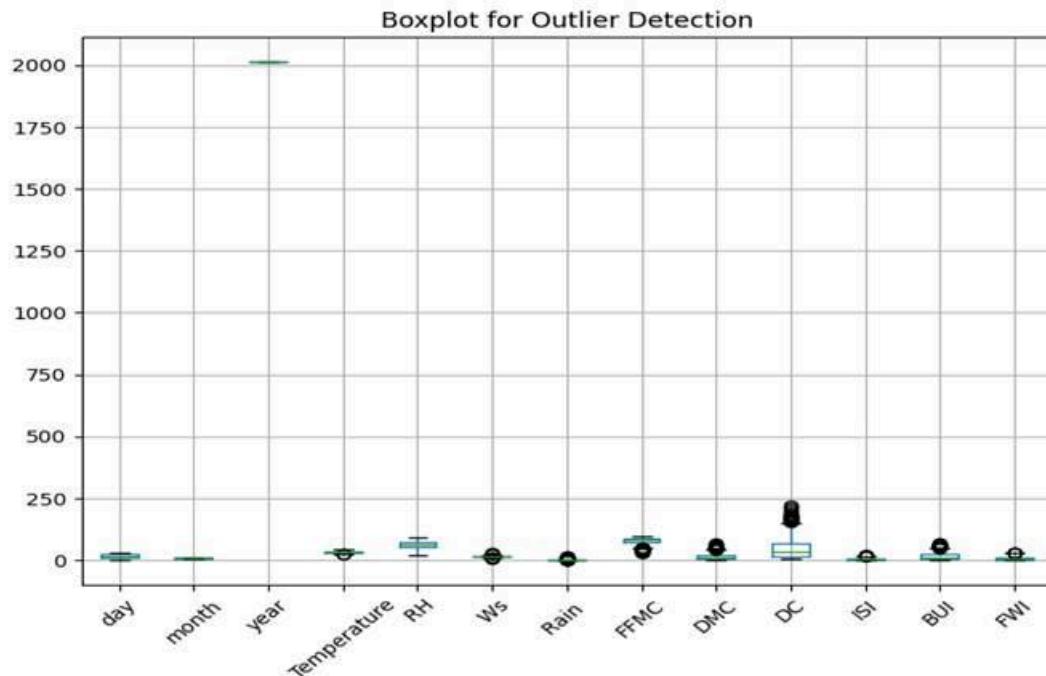

```
dtype: int64
```

Total number of rows with missing values:

```
1
```

A missing-value check was performed to identify incomplete records, revealing that only one row contained a null value in the *Classes* column. This validation helped ensure data completeness and supported appropriate handling before further preprocessing.

## 2. Boxplot and statistical threshold using the IQR method

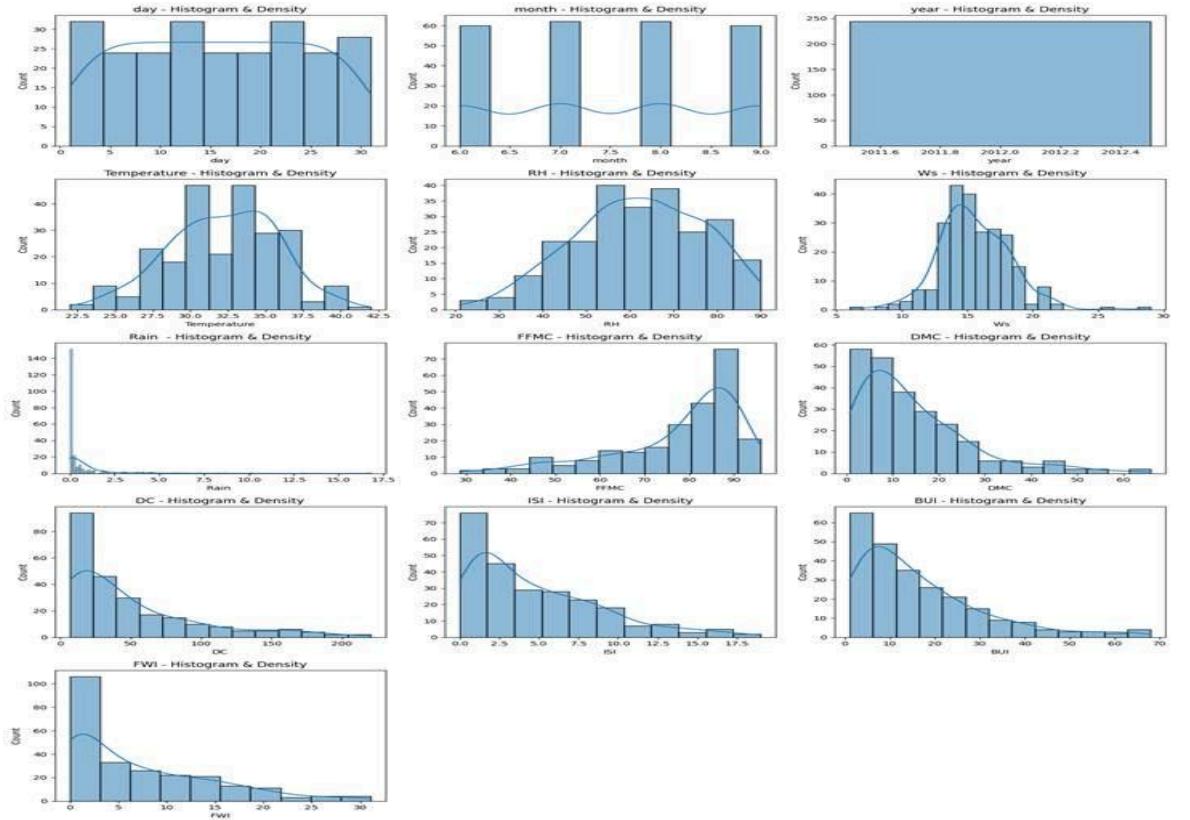

**FIG 1: Outlier Detection**

Outlier detection was performed using both boxplots and the Interquartile Range (IQR) statistical method to identify unusually high or low values across numerical

features. The IQR approach calculated lower and upper bounds for each feature, flagging values that fell outside the  $1.5 \times \text{IQR}$  range as potential outliers. While some features like day, month, year, RH, and DC showed no outliers, others such as Temperature, Wind Speed, Rain, FFMC, DMC, ISI, and BUI contained multiple extreme values. These findings helped reveal variability patterns within the dataset and informed decisions for further cleaning and preprocessing.

### 3. Density Plots and histogram for each feature

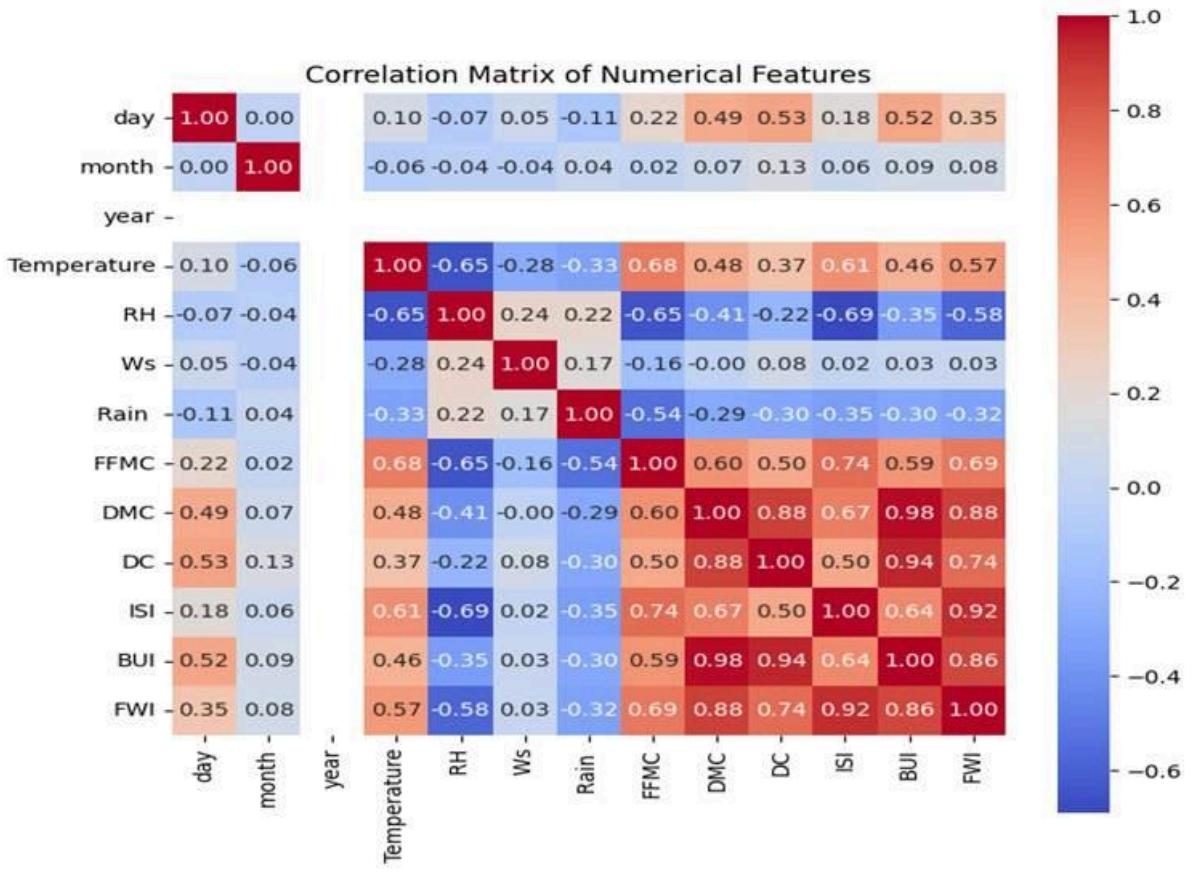

Histograms with KDE density curves were generated for all numerical features to visualize their distributions and identify underlying patterns. These plots helped reveal whether features were normally distributed, skewed, or contained extreme values. Variables like Temperature, RH, and Wind Speed showed smoother, more symmetric distributions, while features such as Rain, DMC, ISI, and BUI displayed strong right-skewness. This visual exploration provided valuable insights for understanding variability and preparing the data for modeling.

**FIG 2: Histogram with KDE curves for features**

### 4. Compute the correlation matrix for numerical features

A correlation matrix was generated to explore relationships among numerical features and identify which variables influence each other most strongly. The heatmap revealed that fire danger indices such as BUI, DMC, FFMC, and ISI have high positive correlations with each other and with Temperature, indicating shared patterns in fire behavior. Relative Humidity showed strong negative correlations with several indices, reflecting its inverse effect on fire risk. These insights helped highlight key predictive features for the Fire Weather Index and guided feature selection for modeling.

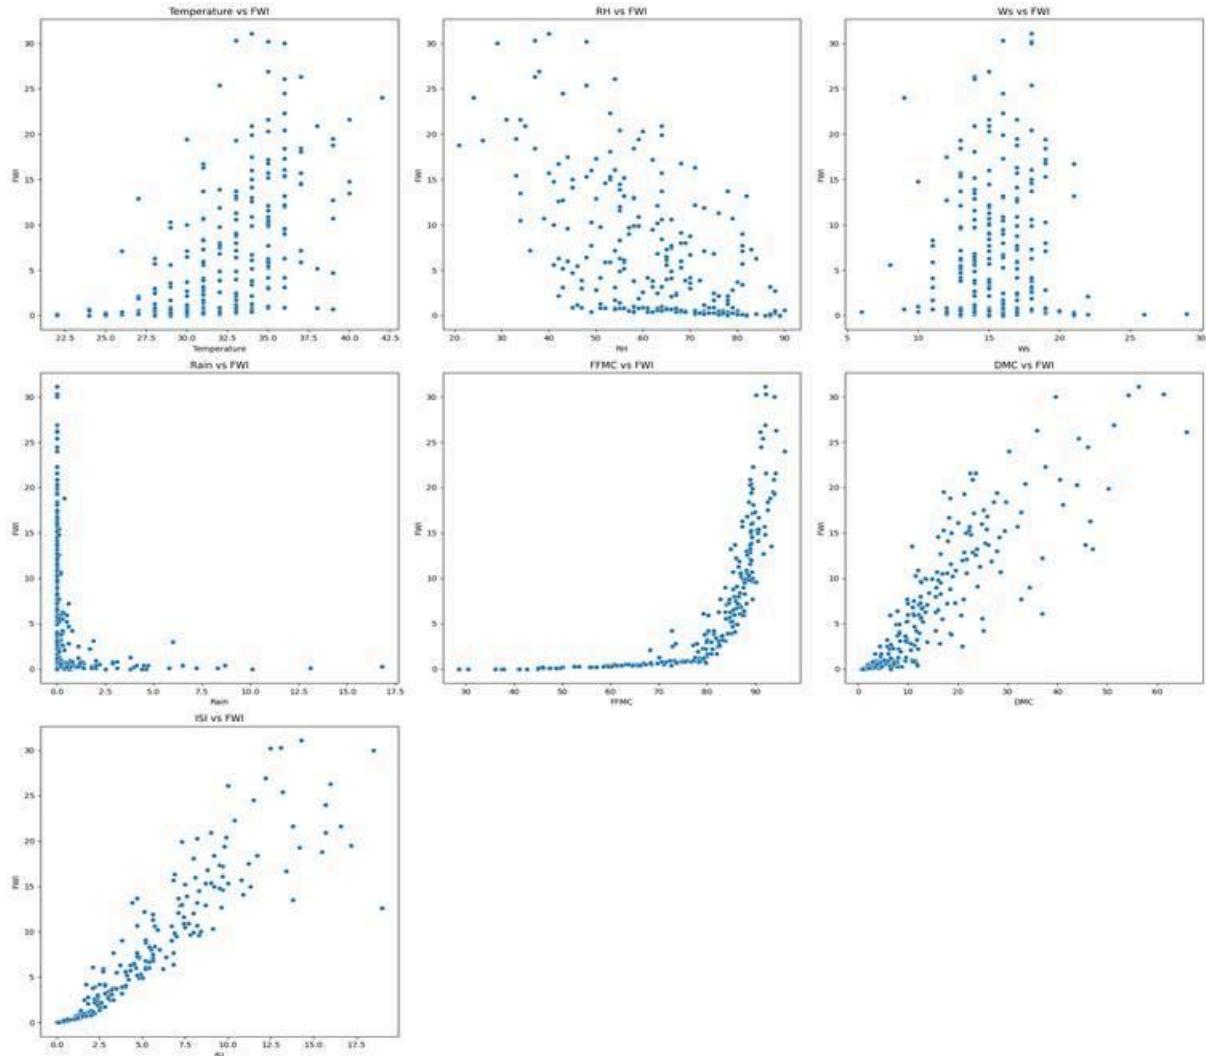

**FIG 3: Correlation matrix**

## 5. Scatter plots for Features vs FWI

Scatterplots were generated to examine how each key environmental feature relates to the Fire Weather Index (FWI). These visualizations helped reveal whether variables like Temperature, RH, Wind Speed, Rain, FFMC, DMC, and ISI show increasing, decreasing, or nonlinear trends with FWI. Features such as FFMC, DMC, and ISI displayed clearer upward patterns, indicating stronger influence on fire danger levels.

In contrast, variables like Rain and Wind Speed showed weaker or more scattered relationships, helping identify which predictors contribute most to FWI modeling.

**FIG 4: Scatterplot for features and FWI**

## 6. Encoding region

Encoded Values:

Region	Region_encoded
--------	----------------

0	Bejaia	0
---	--------	---

1	Bejaia	0
---	--------	---

2	Bejaia	0
---	--------	---

```
3 Bejaia      0  
4 Bejaia      0
```

Region Mapping:

```
{'Bejaia': np.int64(0), 'Sidi-Bel Abbes': np.int64(1)}
```

```
Region          object  
Region_encoded category  
dtype: object
```

The categorical feature *Region* was converted into numerical form using label encoding to make it suitable for machine learning models. Each unique region was assigned a numeric label, with “Bejaia” encoded as 0 and “Sidi-Bel Abbes” encoded as 1. A new column, *Region\_encoded*, was created to store these encoded values. The encoded column was then converted to a categorical datatype to maintain consistency with the original feature.
